Convenience

Seal the last gap in the door

Draught, dirt and pests

The more gaps you close in a door or window, the harder the air is pushed through remaining gaps. On a well-sealed overhead sectional door, bottom the corner between the track and the installation profile leaks most air. This can create uncomfortable draughts for people working in the building.

Not only does the gap allow air to pass, it also makes it possible for mice, insects and dirt to enter the building.

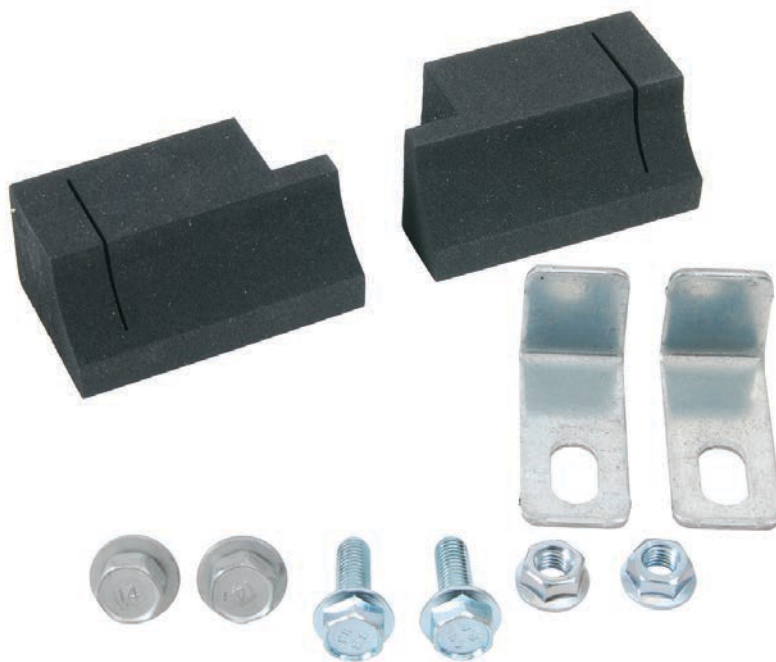

A rubber block is specially designed to fill this small gap in the bottom corner of the door opening.

Low cost solution

Installing a tight door package is quite easy. The package consists of a rubber block and a bracket that pushes the rubber block on the floor. The rubber block has two parts. If the bracket pushes the inner part of the rubber down a lot, the outer part still covers the whole gap.

The bracket is bolted onto the steel installation profile or the wall. Installation material for steel, brick and wood situations is included.

Overview

Available kits for ASSA ABLOY M Tight door package

Name	Type	Remarks
Tightening bottom corners set	Fits to all ASSA ABLOY track types	Contains rubbers blocks and installation brackets Left and right
Tight set bottom Normstahl	Fits to Normstahl track types	Contains rubbers blocks and brackets Left and right
